

### Key points and aims

In this document, the sections on **hospital-based therapy** are intended for clinicians and patients who are new in the administration of immunoglobulins; we hope to provide these people with support and guidance to:

- Ensure the safe preparation and administration of immunoglobulins
- Ensure that the administration of immunoglobulins is as stress-free as possible for the patients and is given in the shortest, but safest time possible
- Manage the patients' needs and maximize the benefits of therapy while minimizing the risk of complications
- Develop a partnership between patients and clinicians, and between patients and infusion partners

The sections on **home-based therapy** are intended to provide guidance and support to nurses that educate and train patients in order to:

- Ensure the safe teaching of immunoglobulin preparation and administration by patients
- Ensure that patients have the “know that, know why, know how” knowledge before starting on home therapy
- Empower patients to self-infuse in a safe and as stress-free way as possible
- Develop a partnership between patients and clinicians, and between patients and infusion partners
